Zag Farkle - Homework #2 Summary

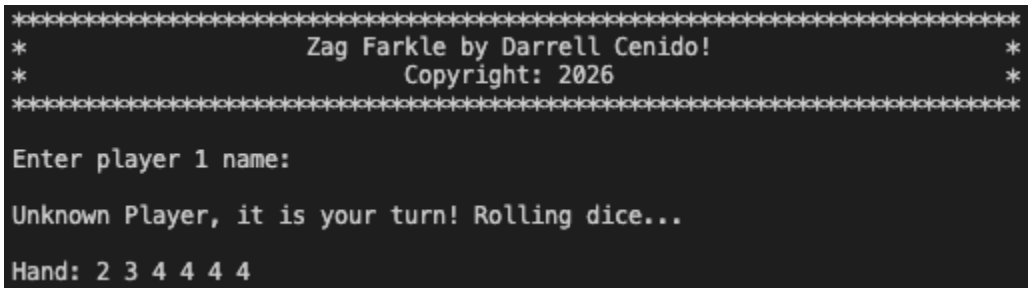

Author: Darrell Cenido | **Course**: CPSC 224 Software Development

Project Goal: Extent the object-oriented Farkle game from Homework #1 by introducing player customization, turn-based banking, unmelded die rerolling mechanics, Hot Hand detection, and a unit testing file.

Design Overview

This application stores components of the game Farkle across multiple Java classes. Farkle.java serves as the entry point, while FarkleGame.java manages the interactive state, user prompting, and the turn loop. Hand.java holds multiple Die.java objects, and FarkleScorer.java consists of the scoring rules. FarkleTester.java tests valid hands.

Starting Screen

Unit Tests

In FarkleTester.java, I tested if the straight is correctly scored by feeding the frequency array [0, 1 , 1 , 1, 1, 1, 1] into FarkleScorer.calculateMeldScore() and checking that the returned value is 1000 points.

Issues

The part that was the most difficult was making sure that the hot hand command worked correctly. I wasn't completely sure on the rules so I was a bit confused about the hot hand game mechanics. When I banked my die that was supposed trigger a hot hand, it wasn't successfully executing because the hot hand mechanics were only in my (R) Reroll command section. So to fix this I also added the command to my (K) Bank meld section as well.

Retrospective

I'm not exactly sure about the game mechanics so it would be helpful to have an official rule book that we are following in order to keep consistency amongst projects in the class.
