

Software Dev HW1 Summary

The goal of this program was to create the game Farkle in an object oriented way. I was able to emulate one round of this game with random numbers being generated as die values and then calculating the score corresponding to these values. It was very helpful to have the scoring chart in the ReadMe.md of the given repository. I constantly referred back to it. I decided to split this into 5 files, Farkle.java, FarkleGame.java, Hand.java, Die.java, and FarkleScorer.java.

Farkle.java was the main driver of the program that declared the game instance and starts the game. FarkleGame.java handles the game play, screen printing, and user prompting. Hand.java handles the six different values of die that are in play. Die.java handles the randomization of a singular die. FarkleScorer.java handled the main game logic and scoring.

At first when looking the initial C++ code that was given and converting it to Java, I noticed that it was printing strings A0-A5 instead of A-F. It caused an error in the logic and didn't add and points to the score. I began by converting everything from the working example given into Java before I split them up into different files. I noticed when converting the C++ to Java, I kept using ' instead of " which caused errors in String vs char datatypes. In other languages I feel as if ' and " are interchangeable so I had to break that habit. If I had more time I probably would have not tried to convert the initial file that was 200+ lines long into an exact Java copy. I felt like I wasted some time doing that before actually breaking it up into multiple files.
